

FieldBus Communication Driver Solution

Overview of fieldbus control

FieldBus communication:

The control command is sent to the driver through the fieldbus communication, and the driver executes the corresponding command action

Simple/efficient wiring flexible control function/positioning, fixed speed, torque control, etc.
Easy to build multi-axis control system/convenient debugging
All interfaces require a unified fieldbus protocol type

Overview

Pulse control:

The control commands are converted to pulses and sent to the driver.
The driver counts the pulses.
The motor is driven by pulses to complete the command action.

Features

Wiring alignment is relatively more/ Prone to signal interference
Single control function / Pulse positioning
Suitable for small control systems
Simple and intuitive, low stand-alone cost

NT series specifications

Model	Peak current	Weight	Power voltage	Dimension	Communication mode	Maximum baud rate	Matched motor
NT60	6A	300g	24-50VDC	118×76×33mm	485	115200	Below 60mm open/closed loop
NT86	8A	700g	18-80VAC	151×97×52mm	485	115200	86mm open/closed loop
NT110	8A	1400g	110-230VAC	151×141×58mm	485	115200	110mm open/closed loop

NT60

485 fieldbus stepper driver NT60, based on RS-485 network to run Modbus RTU protocol, integrated intelligent motion control function.

NT60 matches open loop or closed loop stepper motors base below 60mm.

- Control mode: fixed length/fixed speed/homing/multi-speed/multi-position
- Debugging software: RTConfigurator (multiplexed RS485 interface)
- Power voltage: 24-50V DC
- Typical applications: single axis electric cylinder, assembly line, connection table, multi-axis positioning platform, etc.

Driver function description

ID setting
on=0, off=1
ID=sw1+sw2*2+sw3*4+sw4*8+sw5*16
Make sure the ID number is set correctly before powering on

BDR	SW6	SW7
9600	on	on
19200	off	on
38400	on	off
115200	off	off

The baud rate of the slave station must correspond to the baud rate of the master station
When adjusting the dial code, need to power off and restart the driver to take effect

EP series network diagram

EPR60

The Ethernet fieldbus-controlled stepper driver EPR60 runs on the Modbus TCP protocol based on standard Ethernet interface and integrates a rich set of motion control functions.

- The EPR60 is compatible with open-loop stepper motors base below 60mm.
- Control mode: fixed length/fixed speed/homing/multi-speed/multi-position
- Debugging software: RTConfigurator (USB interface)
- Power voltage: 24-50V DC
- Typical applications: assembly lines, warehousing logistics equipment, multi-axis positioning platforms, etc.

EtherCAT

Real-time FieldBus communication protocol based on industrial Ethernet

EtherCAT overview

ECAT principle

Features

- Efficient transmission mechanism and speed
- Flexible network topology
- Automatic node address configuration for easy maintenance
- Open technology
- Simple hardware, high cost performance
- Suitable for modular collaborative development

CANopen over EtherCAT protocol overview

CoE diagram

EtherCAT modifies the communication mechanism of Ethernet to ensure the real-time performance of the network

CiA402 control mode

Profile Position Mode (PP):
Set position, speed, acceleration and deceleration parameters, and execute relative or absolute position commands from the internal buffer of the driver

Profile Velocity Mode (PV):
Set speed, acceleration and deceleration parameters, and execute the speed command by the internal buffer of the driver on commands from the internal buffer of the driver

Cyclic Synchronous Position Mode (CSP)
The main controller generates a position trajectory and sends the target position (0x607A) to the driver in each PDO update cycle.

Homing Mode (HM)
The relevant parameters need to be set according to the format

PDO and SDO parameters

Process Data Object (PDO):
Process data object
Used to transmit real-time data
Configure the relevant parameters of the driver as PDO parameters, and realize real-time reading and writing of status and commands between the master station and the slave station in each synchronization cycle
For example, parameters such as target position in CSP mode

Service Data Object (SDO):
Service Data Objects
Used to configure static parameters,
Configure the driver parameters that do not need to be changed in real time as SDO parameters, and set the relevant parameters of the slave driver on the master station.
For example, working current and other parameters.

ECR60

The EtherCAT fieldbus stepper driver ECR60 is based on the CoE standard framework and complies with the CiA402 standard. The data transmission rate can reach 100Mb/s, and supports linear, ring and other network topologies.

ECR60 matches open loop stepper motors base below 60mm

- Control mode: PP, PV, CSP, HM, etc.
- Power supply voltage: 24-80V DC
- Input and output: 2-channel differential inputs/4-channel 24V common anode inputs; 2-channel optocoupler isolated outputs
- Typical applications: assembly lines, lithium battery equipment, solar equipment, 3C electronic equipment, etc.

One green indicator and one red indicator	Driver overcurrent
One green indicator and two red indicators	Driver input power overvoltage
One green indicator and three red indicators	Driver internal voltage error
One green indicator and four red indicators	Tracking error exceeds limits
One green indicator and six red indicators	Parameter check error
One green indicator and seven red indicators	Motor phase failure alarm

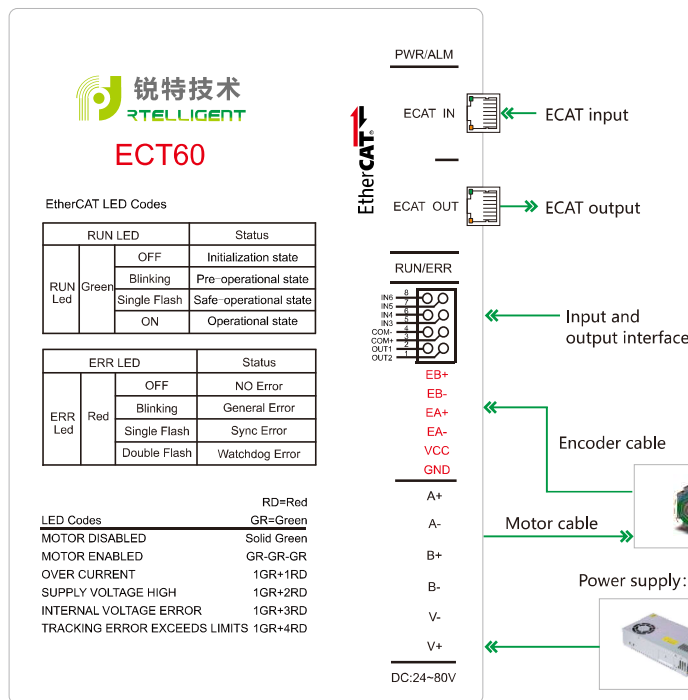

Communication status LED indication-RUN/ERR

LED status	Communication status
RUN GREEN ● Not bright	Initialization
● Slow flash	Pre-operational
● Single flash	Safe-operational
● Constant bright	Operational
ERR RED ● Not bright	No error
● Slow flash	General error
● Single flash	Sync error
● Double flash	Watchdog error

Slow flash: on for 200ms, off for 200ms; repeat
 Single flash: on for 200ms, off for 1s; repeat
 Double flash: on for 200ms, off for 200ms, then on for 200ms, off for 1s; repeat

Power supply interface

AC	24-100VDC/18-80VAC
AC	Power over 150W

Encoder interface

EB+	Encoder phase A/B signal
EB-	
EA+	
EA-	
VCC	Encoder 5V power supply
GND	Provided internally by the driver

Input interface

Input 3	IN3	
Input 4	IN4	Single-ended common anode input
Input 5	IN5	
Input 6	IN6	
COM+	24V common input	

Output interface

Output 1	OUT1	Single-ended common cathode output
Output 2	OUT2	
COM-	Common output	

Motor interface

A+	Closed loop motor cable phase sequence fixed
A-	
B+	Need to connect according to the motor identification
B-	

Installation size

Main parameters and address

Index	Name	Flags	Value
200D	Invert motor direction	RW P	0x0000 (0)
200E	Alarm Code	RO P	0x0000 (0)
200F	Status Code	RO P	0x0084 (132)
2010	Zero Position	RW P	0x0000 (0)
2011	Control mode	RW P	0x0000 (0)
2020	Encoder Resolution	RW P	0x0FA0 (4000)
2021	Encoder Counter in one rev	RO P	0x0000 (0)
2022	Position Trae Error Limit	RW P	0x0000FA0 (4000)
2023:0	Position loop parameters	RW P	> 5 <
2024:0	InPosition parameters	RW P	> 3 <
2025:0	Servo Filters	RW P	> 3 <
2025:01	FV1_HZ	RW P	0x00C8 (200)
2025:02	FV2_HZ	RW P	0x0258 (600)
2025:03	FPOUT_HZ	RW P	0x07D0 (2000)
2026:0	Servo mode2 parameters	RW P	> 5 <
2026:01	PVIA_Kp	RW P	0x07D0 (2000)
2026:02	PVIA_Ki	RW P	0x03E8 (1000)
2026:03	PVIA_Kv1	RW P	0x00C8 (200)
2026:04	PVIA_Kv2	RW P	0x0190 (400)
2026:05	PVIA_Kvff	RW P	0x0000 (0)
2043	Speed Reference	RO P	0
2044	Speed Feedback	RO P	0
2048	Bus Voltage	RO P	0x60D1 (24785)
